
Project Part 2

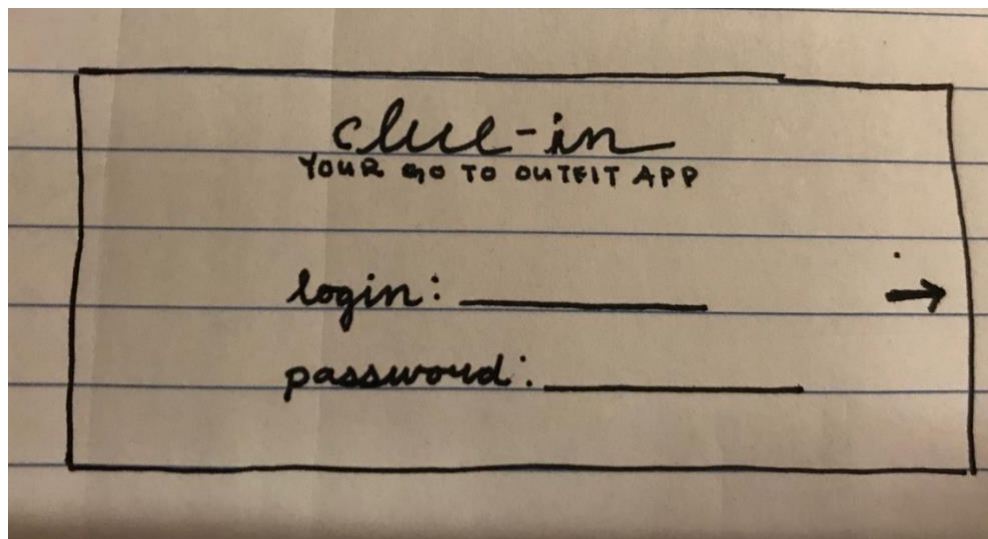

1. **Name:** Carly Romig
2. **Title:** *cluein*
3. **Project Summary:** I'm creating a website that takes articles of clothing from a user's closet and mixes and matches into cohesive, fashionable outfits. This will be used so customers can set up and visualize outfits they want to wear for the week. I'll set up the website to for one customer closet. When finished, my website *cluein* will let a user interact with adding and removing articles of clothing from a mannequin that's been taken from their personal closet. If there isn't an item present in their closet that they want to use, they can search in the store inventory to add the item to their closet. Once I've built out my design, I intend to partner with clothing companies that can advertise clothes that would compliment articles of clothing in a user's *cluein* closet.

4. Project Requirements:

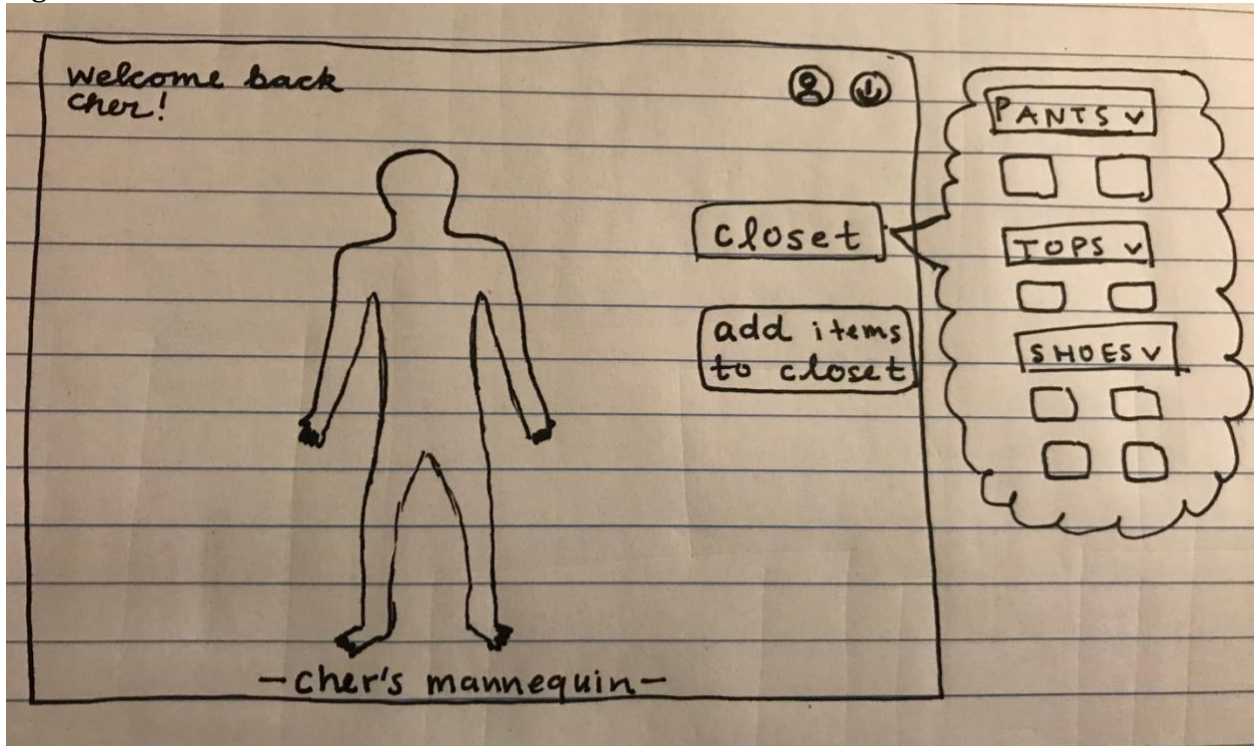

Label	User Requirements Description	
UR-1	Users must be able to add articles of clothing from their closet	
UR-2	Users must be able to remove articles of clothing from their closet	
UR-3	Users must be able to search for articles of clothing that they want for their closet from store inventory	
UR-4	Users must be able to add articles of clothing that they want for their closet from store inventory	
UR-5	Users must be able to visualize their outfits	

5. UI Mockups:

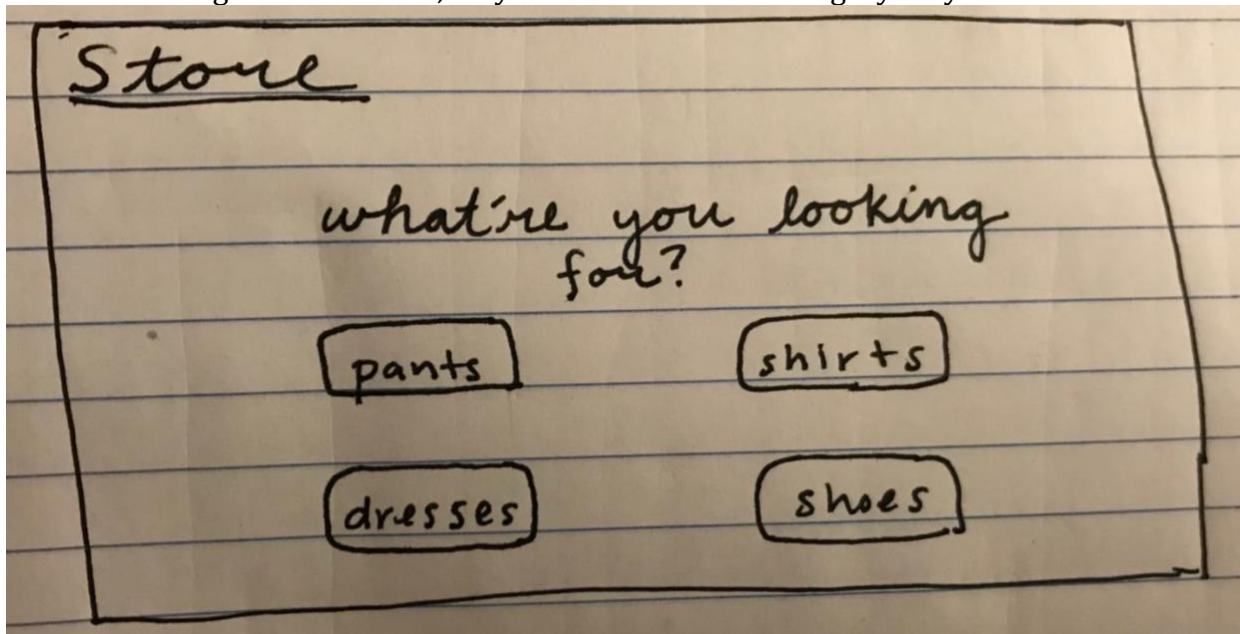

User and Admin login:

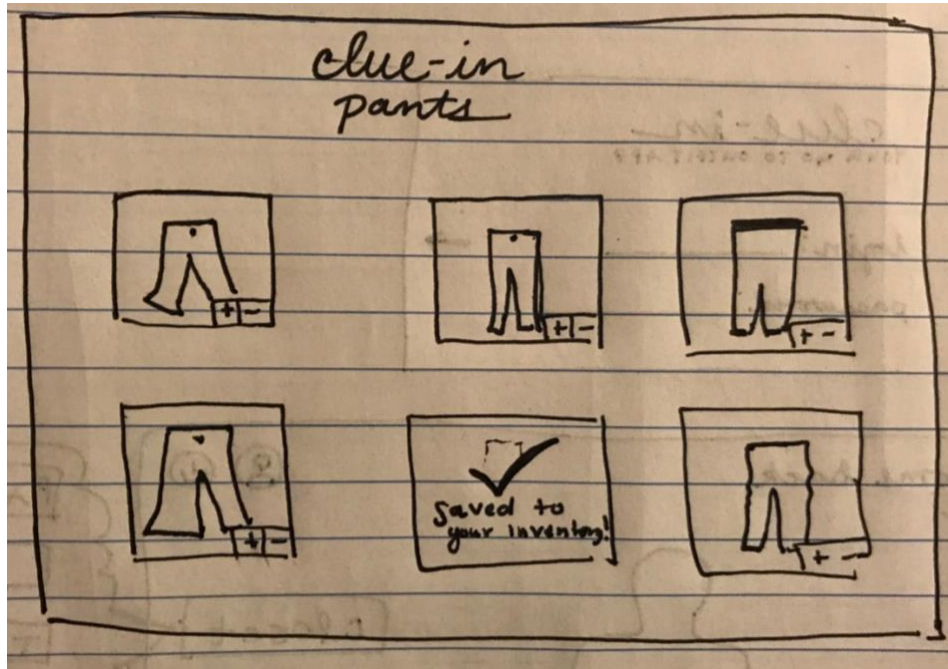

Below is the main page, where the mannequin will be displayed. The user can click the 'closet' button, which will prompt a dropdown menu. They can scroll through articles of clothing depending on section, and mix and match tops and bottoms onto the mannequin. If they want to add more clothing to their closet, they can click "add items to closet." On the top right corner, there's a link to the customer's profile as well as the logout button.

When the user goes to the store, they can click on which category they want to look at:

When the user is on the category page, they can scroll through the category to pick the article of clothing that they want. When the user finds their favorite outfit, they add it to their closet by clicking the plus button. Now the user has more articles of clothing in their closet!

6. Class Diagram:
